PHONE: (410)573-4599 FAX: (410)266-9127 URL: www.fws.gov/chesapeakebay/; www.fws.gov/chesapeakebay/endsppweb/ProjectReview/Index.html

June 07, 2016

Consultation Code: 05E2CB00-2016-SLI-1284

Event Code: 05E2CB00-2016-E-01393 Project Name: Hanover Street Bridge

Subject: List of threatened and endangered species that may occur in your proposed project

location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. This species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 et seq.), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2) (c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 et seq.), and projects affecting these species may require development of an eagle conservation plan

(http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and

http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Endangered Species Act Species List

There are a total of 0 threatened or endangered species on your species list. Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species. Critical habitats listed under the Has Critical Habitat column may or may not lie within your project area. See the Critical habitats within your project area section further below for critical habitat that lies within your project. Please contact the designated FWS office if you have questions.

There are no listed species identified for the vicinity of your project.

Appendix A: FWS National Wildlife Refuges and Fish Hatcheries

There are no refuges or fish hatcheries within your project area.

http://ecos.fws.gov/ipac, 06/07/2016 11:27 AM - Appendix A

Project name: Hanover Street Bridge

Appendix B: NWI Wetlands

The U.S. Fish and Wildlife Service is the principal Federal agency that provides information on the extent and status of wetlands in the U.S., via the National Wetlands Inventory Program (NWI). In addition to impacts to wetlands within your immediate project area, wetlands outside of your project area may need to be considered in any evaluation of project impacts, due to the hydrologic nature of wetlands (for example, project activities may affect local hydrology within, and outside of, your immediate project area). It may be helpful to refer to the USFWS National Wetland Inventory website. The designated FWS office can also assist you. Impacts to wetlands and other aquatic habitats from your project may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal Statutes. Project Proponents should discuss the relationship of these requirements to their project with the Regulatory Program of the appropriate U.S. Army Corps of Engineers District.

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery and/or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Exclusions - Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Precautions - Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of

http://ecos.fws.gov/ipac, 06/07/2016 11:27 AM - Appendix B

Project name: Hanover Street Bridge

this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

The following NWI Wetland types intersect your project area in one or more locations. To understand the NWI Classification Code, see http://wetlandsfws.usgs.gov/Data/interpreters/wetlands.aspx.

Wetland Types	NWI Classification Code
Estuarine and Marine Deepwater	E1UBL6
Estuarine and Marine Deepwater	E1UBL
Estuarine and Marine Wetland	E2EM1P
Estuarine and Marine Wetland	E2EM1P6
Freshwater Emergent Wetland	PEM1Ax
Freshwater Emergent Wetland	PEM1Fx

Ms. Amanda Deering Straughan Environmental Services, Inc. 10245 Old Columbia Road Columbia, Maryland 21046

RE: Environmental Review for Baltimore City Hanover Street Bridge Corridor Plan, City of Baltimore, Maryland.

Dear Ms. Deering:

The Wildlife and Heritage Service has determined that there are no State or Federal records for rare, threatened or endangered species within the boundaries of the project site as delineated. We would also like to point out that the open waters that are adjacent to the southeastern part of the site are known historic waterfowl concentration areas. If there is to be any construction of water-dependent facilities please contact Josh Homyack of the Wildlife and Heritage Service at (410) 928-3650 or josh.homyack@maryland.gov for further technical assistance regarding waterfowl. Please note that the utilization of state funds, or the need to obtain a state-authorized permit, may warrant additional evaluations that could lead to protection or survey recommendations by the Wildlife and Heritage Service.

Thank you for allowing us the opportunity to review this project. If you should have any further questions regarding this information, please contact me at (410) 260-8573.

Sincerely,

Lori A. Byrne,

Loui a. Bym

Subject: Information Concerning Fishery Resources in Hanover Street Bridge Area

Hi Amanda:

I am responding to your June 20, 2016 letter regarding the Baltimore City Hanover Street Bridge Corridor Plan. Using our Coastal Atlas (http://dnr2.maryland.gov/ccs/Pages/coastalatlas.aspx), I found:

Herring Spawning Habitat Herring Juvenile Habitat White Perch Juvenile Habitat

in the vicinity of the project. John Mullican can put you in touch with the appropriate field biologist to get more specific and up-to-date information in this area.

John: Here's some relevant information from Amanda's letter.

"The study area includes two 8-digit watersheds: Patapsco River Lower North Branch (02130906) and Baltimore Harbor watersheds (02130903)."

Amanda requested any information concerning state threatened or endangered fishery resources, including anadromous fish that may occur in the area.

Best, Joe

Subject: Re: Information Concerning Fishery Resources in Hanover Street Bridge Area

Amanda,

The Freshwater Fisheries Program Region Manager for Baltimore County is Mark Staley (copied). I have also copied Paul Piavis for comments regarding resident species.

The Hanover Street Bridge improvement project does not appear to impact any freshwater fisheries. Gwynns Falls and Jones Falls are Put-and-Take Trout Management Areas. However, stocking takes place further upstream in the watershed and would not be affected by this project.

Thank you, John

Subject: Re: FW: Information Concerning Fishery Resources in Hanover Street Bridge Area

Yes, I concur with John that <u>freshwater</u> fisheries resources will not be impacted by this project. Largemouth bass are present and a recreational resource just upstream of the Hanover St. bridge in the tidal Patapsco River.

Millions of dollars are being spent to restore anadromous fish habitat and populations in the Patapsco River upstream of the site but I am not involved with that effort.

The area around the site is heavily used by local recreational fishermen and crabbers. Any measures that could be included to allow or expand angler access would be helpful to the local community.

Mark

Mr. Staley,

I am following up on John Mullican's email below regarding freshwater fisheries located near the Hanover Street Bridge Improvement Project.

In the email below, John stated that the project appeared to not impact freshwater fisheries, do you concur with this determination?

Thank you for your time and any additional information you can provide.

Subject: Re: FW: Information Concerning Fishery Resources in Hanover Street Bridge Area

Amanda, We don't have any ongoing surveys near the project area. That being said, the Harbor Hospital area is relatively popular for recreational fishermen, generally targeting channel catfish and white perch. And they can be quite successful, the ramp at that location also provides access for at least a few kayak fishermen that pursue perch and pre-migratory striped bass. There is a high likelihood that yellow perch spawn in the middle branch area, however, given the developed nature of the area, successful spawning may already be limited.

Regardless, additional sediment input into the system due to construction should be limited in the time frame of mid February through mid April. This time period coincides with herring and yellow and white perch spawning. As far as juvenile habitat for most resident species and early migratory species, that general area does not seem to hold significant suitable habitat. It's already pretty well degraded.

Sent: Monday, July 25, 2016 12:24 PM

To: Amanda Deering

Subject: Hanover Street Bridge: response to info request

Dear Ms. Deering:

We have reviewed the information you provided to us regarding the Hanover Street Bridge. We offer the following preliminary comments pursuant to the Endangered Species Act, the Fish and Wildlife Coordination Act, and the Magnuson-Stevens Fishery Conservation and Management Act:

Endangered Species Act

If you haven't already, please contact Brian Hopper of our Protected Resources Division on endangered species. He can be reached at brian.d.hopper@noaa.gov or 410-573-4592.

Fish and Wildlife Coordination Act

The Patapsco River provides habitat for a variety of NOAA trust resources such as anadromous fish. In particular, the area surrounding the Hanover Street Bridge is mapped as white perch spawning habitat. Efforts should be made to avoid and minimize adverse effects to the aquatic environment. Best management practices should be used to minimize the release of suspended sediment in the waterway and acoustic impacts to fish in the area. Depending on what in-water work is planned, time of year restrictions (February 15 through June 15) may be necessary during anadromous fish spawning in the area.

Magnuson-Stevens Fishery Conservation and Management Act Essential Fish Habitat

Essential Fish Habitat (EFH) has been designated within the project area. Further EFH consultation by the federal action agency may be required as part of the federal permit process. For a listing of EFH and further information, please go to our website at: http://www.greateratlantic.fisheries.noaa.gov/habitat. The website also contains information on descriptions of EFH for each species, guidance on the EFH consultation process including EFH assessments, and information relevant to other NMFS mandates. If you wish to discuss this further, please e-mail https://www.greateratlantic.fisheries.noaa.gov/habitat. The website also contains information or descriptions of EFH for each species, guidance on the EFH consultation process including EFH assessments, and information relevant to other NMFS mandates. If you wish to discuss this further, please e-mail Kristy.Beard@noaa.gov or call 410-573-4542.

Thanks!

APPENDIX B EXISTING MARKET DYNAMICS ANALYSIS

Demographics

Populations and Households

Studying the existing market dynamics of an area begins with examining the demographics, including population and household growth. A growing population can indicate the need for new services. As of 2015, the population of the Study Area was 32,968, and the population of the City of Baltimore was 620,218 (see **Table B. 1**). Both populations are expected to grow. The Study Area's population is projected to reach 33,535 by 2020, and Baltimore City's population is projected to reach 622,015 by 2020. The Baltimore-Columbia-Towson MSA had a population of 2,778,512 in 2015 and is projected to grow by 3.0 percent to 2,863,225 people by 2020.

Table B. 1: Population and Growth of Economic Study Area and Surrounding Areas

Goography		Population		Change,	, 2010 to 2	015	Change, 2015 to 2020

Source: ESRI; AECOM, April 2016.

The age profile of an area can indicate the types of development and services needed, as well as give an indication of how a population's needs might change. Overall, the Study Area has a younger population than the City as a whole. In 2015, the median age of the Study Area was 32 years old versus 35.3 in Baltimore.

Population pyramids show the largest age group in the Study Area is 25 to 29 years old followed by the 30 to 34 years old and 20 to 24 years old groups. By 2020, the Study Area's population pyramid projects the largest age group to remain at 25 to 29 years old followed by 30 to 34 years old and 35 to 39 years. Similar to the Study Area, the City of Baltimore's largest age group is 25 to 29 years old with the 20 to 24 years old age group following closely behind. All three of these age groups are considered to be prime "workforce" age, and in the Study Area, the ages 20 to 29 are typically ages of new household formation and transition which can have unique housing demands.

Unlike the Study Area, Baltimore City's population is more evenly distributed among age groups, which can be seen in **Figure B. 1**. One of the possible reasons the 25 to 29 years old group is expected to remain the largest is the presence of major universities in Baltimore City. The City of Baltimore is home to the following colleges and universities: Coppin State University, Morgan State University, University of Baltimore, University of Maryland, Baltimore, Johns Hopkins University, Loyola University, Maryland Institute College of Art, Notre Dame of Maryland University, and Sojourner-Douglass College.

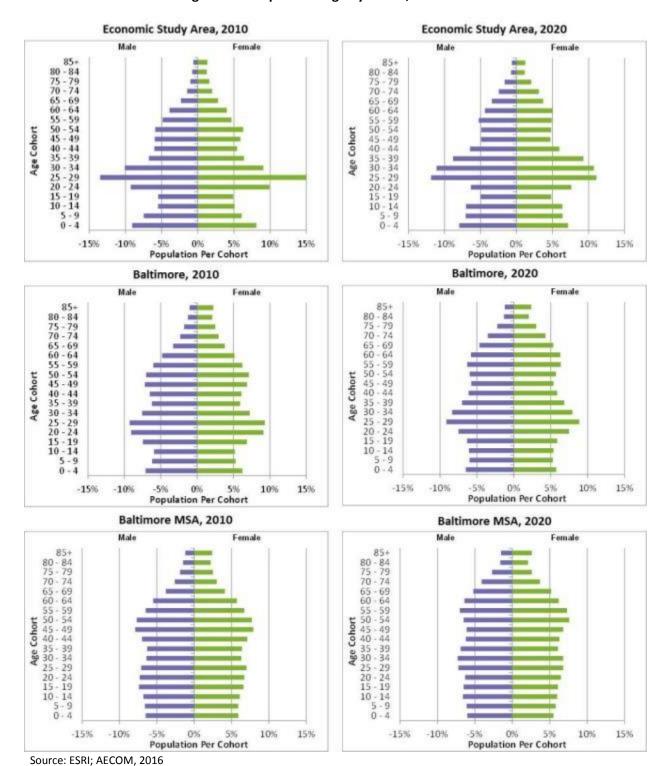

In addition to having an overall younger population, the area has a greater concentration of population aged under 10 years than the City and MSA (15 percent versus approximately 12 percent in the comparative geographies) and a lesser concentration of those aged 65 and older (8.9 percent versus 13.3 percent in Baltimore and 14.7 percent in the MSA). The Baltimore MSA trends older with a median age of 38.9 years old and the largest age group being 45 to 49 years old.

Figure B. 1: Population Age Pyramids, 2010 and 2020

Households form the basic consumer unit for housing and retail, and so growth in households can indicate support for additional space for these land uses. As seen in **Table B. 3**, in 2015, the Study Area had 13,685 households, and by 2020 is anticipated to grow by 2.1 percent to 13,972 households. In 2015, Baltimore City had 251,433 households, and is projected to add 1,152 households by 2020, a growth of 0.5 percent over the time period.

Both the Study Area and City of Baltimore have an average household size of 2.4 people. Within the Study Area, the south region has the most households with 50 percent of all Study Area households in 2015. The west region has the fewest number of households within the Study Area with only 4.2 percent of all Study Area households in 2015. The east region of the Study Area has grown the most with an 8.6 percent increase in households from 2010 to 2015 and 45.8 percent of all Study Area households in 2015. While the south region still has the most households within the Study Area, the population and number of households in the region have been in decline. From 2010 to 2015, the south region has seen a decrease in households by 0.5 percent, and is expected to decrease by another 0.3 percent by 2020.

Table B. 3: Households and Growth in Economic Study Area and Surrounding Areas

Geography		Households	S	Change,	, 2010 to 2	2015	Chang	je, 2015 to	2015 to 2020

Housing Units

There are over 15,000 dwelling units within the 7.9-square mile Study Area. The Study Area accounts for 5.2 percent of all City of Baltimore dwelling units. As shown in **Table B. 5**, 87.2 percent of all dwelling units in the Study Area are occupied compared to 83.4 percent of the City of Baltimore's dwelling units and 91.4 percent of all MSA dwelling units.

In the Study Area, more dwelling units are rented than owned. In fact, 50.7 percent of all Study Area dwelling units are rented compared to 45.9 percent in Baltimore City and 32.4 percent in the MSA.

Table B. 5: Housing Units by Occupancy Status and Tenure of Economic Study Area and Surrounding Areas

Housing	Housing Units by Occupancy Status and Tenure, 2015

Source: ESRI; AECOM, 2016.

When observing housing occupancy and tenure within the Study Area, there is a divide between regions. A majority of dwelling units are occupied among the three regions: 86.2 percent occupancy in the south region, 77.7 percent occupancy in the west region, and 89.5 percent occupancy in the east region. The divide is more apparent in tenure. In the south region, 64.2 percent of all dwelling units are rented, whereas almost half of that figure – 35.8 percent – are rented in the east region. The amount of owned units in the Study Area is highest in the east region with 53.7 percent. The south and west regions have owned dwelling unit shares of 21.9 percent and 30.6 percent respectively.

Table B. 6: Housing Units by Occupancy Status and Tenure of Economic Study Area and Its Regions

Table B. 7 shows the types of dwelling units in the Study Area, City of Baltimore, and the Baltimore MSA. The most common type of housing unit in the Baltimore MSA is a single family detached unit. However, in the City of Baltimore, 52.8 percent of all housing units are single family attached units. Much like the City, the Study Area's most common housing unit type is a single family attached unit representing 73.6 percent of all units.

Table B. 7: Housing Units by Units in Structure of Economic Study Area and Surrounding Areas

Source: ESRI; AECOM, 2016.

Within the Study Area, single family attached units are the most common type of housing units. 67.6 percent of all housing units in the south region are single family attached. 81.4 percent of housing units in the west region are single family attached, and 80.4 percent of housing units in the east region are single family attached units (See **Table B. 8**). There is barely a presence of high-density structures in the south and west regions: 0.8 percent of all structures in the south and 0.1 percent in the west have 50 or more units. In the east region, 7.7 percent of housing structures are higher-density having 50 or more units. While this percentage as a whole of the region itself is not high, it is much higher than its surrounding regions.

Household Income and Access to Privately-Owned Vehicles

Nearly one-third – 31.3 percent – of households in the Study Area earn less than \$25,000 a year. Nearly a quarter – 23.1 percent – of all households in the study area earn between \$25,000 and \$49,999.

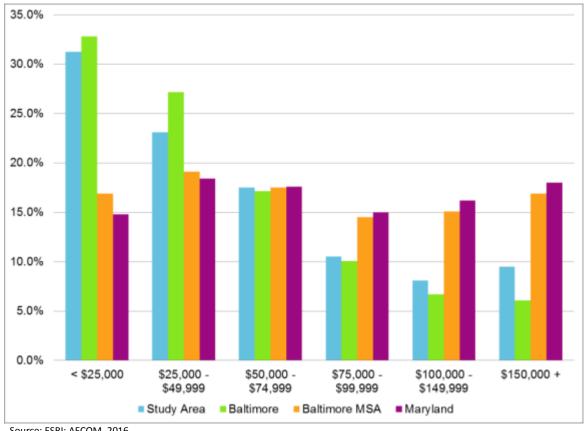

Similarly, these are the two largest income brackets in the City of Baltimore with 32.8 percent and 27.2 percent respectively. Income is more evenly distributed in the MSA with 19.1 percent earning between \$25,000 and \$49,000. The second largest income bracket in the MSA is \$50,000 to \$74,999 with 17.5 percent of all households.

Figure B. 2: Comparison of Share of Households by Household Income in Economic Study Area and **Surrounding Areas, 2015**

Source: ESRI; AECOM, 2016

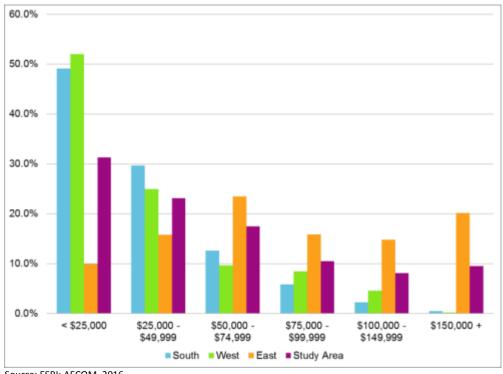

Household income in the Study Area is higher than the City of Baltimore but less than the Baltimore MSA. Median household income for the Study Area was \$43,991 in 2015. Baltimore City and the MSA's median household incomes in 2015 were \$39,306 and \$68,363 respectively. While the Study Area's median household income is not the lowest in the region, the median household income within the Study Area varies greatly, and some regions of the Study Area earn significantly less than others. In 2015, median household income for the south, west, and east regions of the Study Area were \$25,457, \$23,404, and \$75,890 respectively. Figure B. 3 shows the disparity within the Study Area by comparing household income brackets by Study Area regions. As the household income increases, the share of households in those brackets decreases drastically for south and west regions, and the opposite occurs for east regions.

Figure B. 3: Comparison of Share of Households by Household Income Economic Study Area and Its Regions, 2015

Source: ESRI; AECOM, 2016

The number of vehicles available per household can indicate access to services, general mobility, and presence of disposable income. While this indicator is less significant in an urban location—where transit is more prevalent—because of the multimodal transportation focus of the Hanover Street Corridor study, it is relevant. Households with no vehicles also tend to be more multimodal than households with several vehicles available. The data shows 28.1 percent of households in the Study Area own no vehicles and 30.3 percent of households in the City of Baltimore own no vehicles.

Unsurprisingly, the differences in income in study area regions are reflected in vehicle ownership. The south region of the Study Area has 44.7 percent of households without access to a vehicle while the east region only has 8.6 percent of households without vehicles. Alternatively, 40.5 percent of east region households own two vehicles whereas only 12.9 percent of south region households own two vehicles.

Figure B. 4 is a map of how many households own no vehicles by census tract. It shows that, in a census tract in the south region of the Study Area, 72 percent of households have no vehicles available. This is important to note considering 54.7 percent of the Study Area households and 56.7 percent of the Study Area population is located in the south region; in other words, the most heavily-populated region of the Study Area has the highest share of households without access to a vehicle and thus has a higher reliance on transit.

ACS 2014 All Households
By Vehicles Available: 0

0% - 2.97%
2.98% - 16.69%
16.7% - 43.34%
16.7% - 72.01%

Figure B. 4: Percent of Households Owning No Vehicles by Census Tract

Source: ESRI; AECOM, 2016

While it may appear as if half of the south region has no households without any vehicles, there are only 41 households and 76 people in the entire Fairfield Area as of the 2009-2013 ACS. Referring back to **Figure 3-1**, the base map shows the Fairfield Area to be the same as the green census tract in the south region in **Figure B. 4**. The other census tracts in the south region have anywhere from 16.7 percent to 72.0 percent of households owning no vehicles. Census tracts in the west region have anywhere from 16.7 to 43.3 percent of households without access to a vehicle.

Household Spending

Households in the Study Area spent over \$630 million on goods and services in 2015. **Table B. 9** shows this spending averages out to \$46,091 per household. South region households spent over \$164 million, west region households spent over \$14 million, and east region households spent over \$449 million on goods and services.

Table B. 9: Household Goods and Services Expenditures by Economic Study Area and Its Regions, 2015

Hous	ehold Expenditure	es, 2015
		Average Per
Region	Total Spent	Household
South	\$164,273,786	\$24,010
West	\$14,488,301	\$25,463
East	\$449,151,757	\$71,589
Study Area	\$630,756,507	\$46,091

Source: ESRI: AECOM, 2016.

Food spending accounts for 16.5 percent of south region household total spending, 16.1 percent of west region households' total spending, and 16.3 percent of east region households' retail goods and services expenditures. Most of these expenditures are for food at home (see **Table B. 10**). Households in the south region spend almost \$4,000 annually on all food expenditures. West region households spend \$4,094. East region households spend almost three times as much on food as south and west region households do. In addition, east region households spend more than three times the amount south and west region households do on food away from home, alcoholic beverages, and nonalcoholic beverages at home. While east region households outspend west and south region households in every category of retail goods and services expenditures, it is important to note the presence of a "food desert" in the south region. This most likely affects the amount spent on food by households in this region. The concept of "food deserts" and this existing condition will be explained in more detail later on in this report.

Table B. 10: Average annual Household Food Spending by Economic Study area and Its Regions, 2015

Average Annual Household Food Spending, 2015								
Type of Food Expenditures	South	West	East	Study Area				
Total Food Expenditures	\$3,957	\$4,094	\$11,669	\$7,551				
Food at Home	\$2,477	\$2,583	\$6,997	\$4,638				
Food Away from Home	\$1,480	\$1,512	\$4,672	\$2,913				
Alcoholic Beverages	\$249	\$250	\$874	\$516				
Nonalcoholic Beverages at Home	\$243	\$256	\$670	\$450

,

Educational Attainment

Educational attainment can indicate workforce readiness for various types of industries and also tends to reflect the economic potential of households in the area. Overall, educational attainment in the Study

Area is higher than Baltimore City (See Figure B. 5). The population aged 25 years and older has a greater share of bachelors, associates, and graduate and professional degrees than the City of Baltimore. Alternatively, Baltimore City has a higher share of people with high school diplomas and about the same share of people without a high school diploma. In the Study Area, 32.5 percent of people aged 25 and older have a bachelors or associates degree and 19.3 have a graduate or professional degree. In the City of Baltimore, the share of people aged 25 and older with a bachelors or associates degree is 27.8 percent. 18.8 percent of the same population in Baltimore City has a graduate or professional degree. While the Study Area has a slightly higher educational attainment than the City of Baltimore, it falls behind the MSA's educational attainment. 37.2 percent of the population aged 25 and older in the MSA has a bachelors or associates degree and 22.4 percent has a graduate or professional degree.

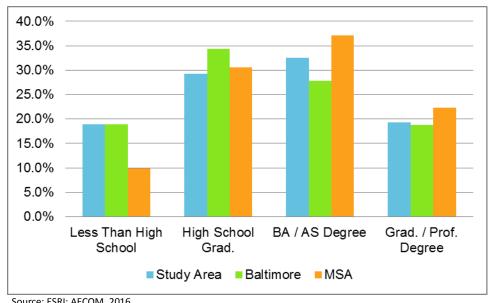

Figure B. 5: Educational Attainment Comparison, 2015

Source: ESRI; AECOM, 2016

While the Economic Study Area's educational attainment is slightly higher than the City of Baltimore's, there is disparity within the Study Area itself. Figure B. 6 shows the comparison of educational attainment within the Study Area. The south and west regions have significantly higher shares of people with a high school diploma or no high school education than the east region. Consequently, the east region has a much larger share of people with bachelors, associates, and graduate or professional degrees than the west or south regions. The east region of the Study Area is so highly educated, its shares of people with bachelors, associates, and graduate or professional degrees is much higher than the average of the entire Study Area. In the south region, 29.1 percent and, in the west region, 33.9 percent of populations aged 25 and older have less than a high school education whereas only 9.5 percent of the same population in the east region has less than a high school level education. In the east region, 39.6 percent of the 25 and older population has a bachelors or associates degree in comparison to the south and west regions, which only have 10.0 and 10.6 percent of the same populations with a

bachelors or associates respectively. Only 1.9 percent of the 25 and older population in the south region have a graduate or professional degree. In comparison, 28.0 percent of the 25 and older population in the east region have a graduate or professional degree.

Employment and Industries

Labor Force and Unemployment

Figure B. 7 shows historical quarterly unemployment rates of the City of Baltimore, the Baltimore MSA, and the State of Maryland. Baltimore City, the MSA, and the State of Maryland have had similar unemployment trends. Despite having similar trends, the City of Baltimore has always had significantly higher unemployment rates than the MSA or the state. At the trough, or lowest point of the unemployment cycle, Baltimore City had a 5.1 percent unemployment rate. This was in Q4 of 2008. At the same time, the MSA and the state had unemployment rates of 3.3 percent and 3.2 percent respectively. At the peak of unemployment, or the highest point, Baltimore City had 11.6 percent unemployment, which was in Q3 of 2010. The peaks for the MSA and state were 8.6 in Q1 2010 and 8.2 in Q1 2010 respectively. While all three jurisdictions are experiencing a decline in unemployment, the City of Baltimore still has a much higher unemployment rate than the MSA or state. As of Q4 2015, Baltimore, the MSA and the state had unemployment rates of 7.3 percent, 5.35 percent, and 4.8 percent respectively.

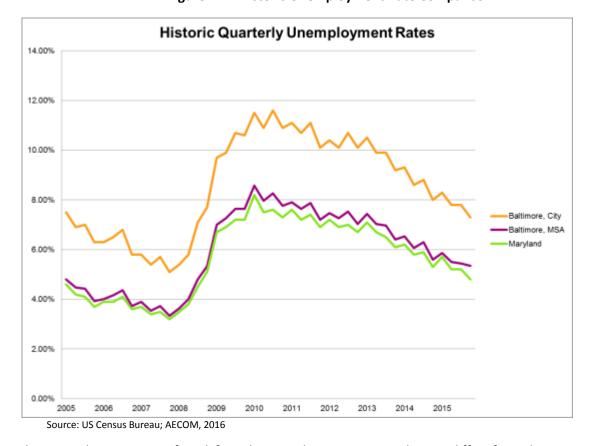

HANOVER STREET
CORRIDOR STUDY
includes the Vietnam Veterans Memorial Bridge

Figure B. 7: Historic Unemployment Rate Comparison

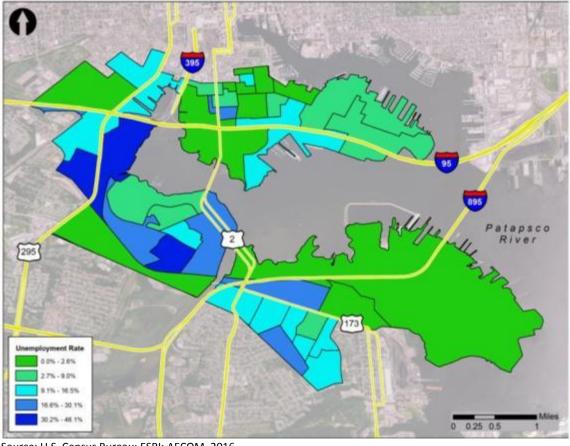

The unemployment rate of work force living in the Economic Study Area differs from the area overall. The south area has an unemployment rate of 17.5 percent, compared to only 5.7 percent in the east area. This is illustrated by census tract in **Figure B. 8.**

Figure B. 8: Map of Unemployment by Census Tract

West	789	4,669	16.9%						
East	581	10,139	5.7%						
Study Area	3,793	28,669	13.2%						

Source: US Census Bureau; AECOM 2016.

Employment by Industry

Baltimore is known for its industrial-dominated economy with its presence of manufacturing, warehousing, transportation, and other similar activities and employment types. While industrial production and manufacturing are known to dominate the Baltimore economy, they are not the only industries with high concentrations of employments in the City. In fact, the industry with the highest share of employees is health care (See **Table B. 12**). The second largest industry in terms of employment

in Baltimore City is educational services with 14.8 percent. The top two industries are no surprise given the significant presence of hospitals, medical facilities, and universities within the City.

Within the Economic Study Area, 26.0 percent of employees work in transportation and warehousing. Only 4.4 percent of Baltimore City employees and 3.2 percent of MSA employees work in this industry. The second and third largest industries for employment in the Economic Study Area are manufacturing and health care with 11.7 percent and 9.2 percent respectively. In the MSA, health care, retail trade and education services are the top three industries for employment with 15.2 percent, 10.9 percent, and 10.6 percent respectively.

Table B. 12: Shares of At Place Employment by Industry in the Economic Study area and Surrounding Areas, 2014

Shares of Employment By Industry, 2014

Source: US Census Bureau; AECOM, 2016.

Because the Economic Study Area's largest employment industry – transportation and warehousing – has a share of employment more than five times higher than Baltimore City and the MSA, it is important to observe the concentrations of employment within the Economic Study Area regions. **Table B. 13** shows the share of employment by industry within each region.

The south region's top three employment industries are transportation and warehousing, health care, and administration and support waste management and remediation with 33.2 percent, 18.7 percent and 8.8 percent respectively. The west region's top three employment industries are manufacturing, wholesale trade, and construction with 31.3 percent, 25.3 percent, and 13.1 percent respectively. The

east region's top three employment industries are transportation and warehousing, manufacturing, and retail trade with 27.3 percent, 9.3 percent, and 8.7 percent respectively. There is no agriculture or mining employment anywhere in the Economic Study Area.

Table B. 13: Shares of At Place Employment by Industry in Economic Study Area and Its Regions, 2014

Major Employers

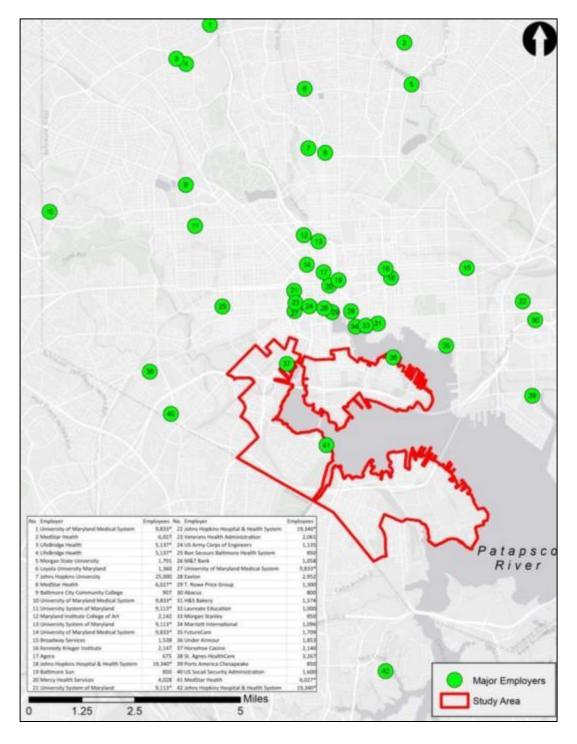

The Baltimore Department of Commerce published a list of Baltimore's major employers. This list contained the name of the employer, the industry type, and the amount of employees. **Figure B. 9** maps out the top 32 employers and shows the amount of employees each employer has. The map shows 42 employers because five of the 32 employers have multiple locations and each location has been represented. Of the top 32 employers in Baltimore, three fall in the Economic Study Area: MedStar Health, Horseshoe Casino, and Under Armour. Together, these three entities employ 10,020 people. The City of Baltimore's top 3 employers are Johns Hopkins University, Johns Hopkins Hospital and Health System, and the University System of Maryland with over 9,000 employees each.

Figure B. 9: Baltimore's Major Employers

^{*}Denotes employer with multiple locations; each location shows total employment figure not location employment. Source: Baltimore Department of Commerce; ESRI; AECOM, 2016

Resident Employment by Industry

In addition to the employment by industry within the Economic Study Area, the study also includes the industries in which Economic Study Area residents are employed. There is a disconnect between the predominant industries of the businesses in the Economic Study Area and the industries in which residents are employed. The major employment industries of south region residents are health care and social assistance; retail trade; administration and support, waste management and remediation; and accommodation and food services. The health care and social services industry accounts for 16.8 percent of south region residents' employment. In the south region, 13.9 percent work in retail trade, 10.6 percent work in administration and support and waste management and remediation, and 9.8 percent work in accommodation and food services. These four industries account for 51.1 percent of all south region residents' employment. These figures can be seen in **Figure B. 10.**

Similar to south region residents, the top employment industries of residents in the west region are: health care and social assistance; administration and support, waste management and remediation; retail trade; and accommodation and food services. The health care and social assistance industry accounts for 17.4 percent of all west region residents' employment. In the west region, 13.6 percent of west region residents have administration and support, waste management and remediation jobs, 13.0 percent of west region residents work in retail trade, and 9.9 percent work in accommodation and food services. These four industries account for 53.9 percent of all west region residents' employment.

East region residents work in mostly different industries than west and south region residents do. The top employment industries for east region residents are: professional, scientific, and technical services; health care and social assistance; educational services; accommodation and food services; and finance and insurance. The professional, scientific, and technical services industry accounts for 14.6 percent of east region residents' employment. **Figure B. 10** shows 13.6 percent of east region residents work in health care and social assistance. In the east region, 12.1 percent of residents work in educational services, 7.2 percent work in accommodation and food services, and 6.5 percent work in finance and insurance.

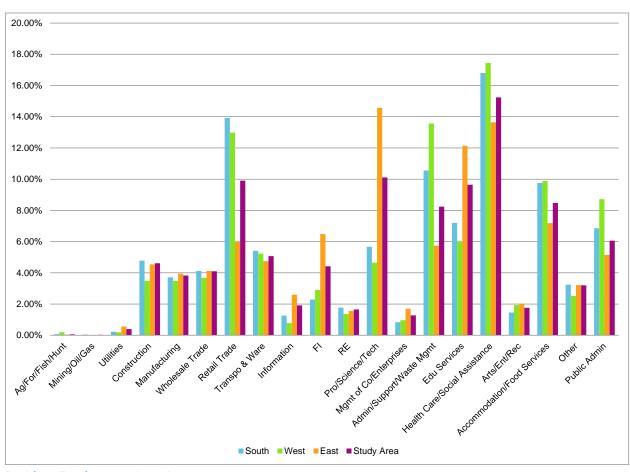

Figure B. 10: Distribution of Employment by Industry of Economic Study Area Regions and the Economic Study Area, 2014

Source: US Census Bureau, 2014; AECOM, 2016.

Resident Employment Location

Figure B. 11 shows where Cherry Hill residents work by ZIP code and **Figure B. 12** shows where Brooklyn residents work by ZIP code. It is important to understand and visualize where and how far away people work from their residences. Lack of vehicles for households has already been observed in the south region, and observations and analysis of existing public transportation systems is reported later in this document. While most south region residents work less than 10 miles from their homes, a majority of these residents also do not have their own vehicles and rely heavily on public transportation and other alternative modes of transportation.

Figure B. 11 shows that 48 percent of Cherry Hill residents work in the Central Business District and South Baltimore. Around one-third – 30.1 percent – of Cherry Hill residents work in Anne Arundel County. The remainder – 20.9 percent – work further north or east of the CBD. **Figure B. 12** shows the top two ZIP codes for where Brooklyn residents work to be in Anne Arundel County and the Baltimore

CBD: 21061 and 20201 respectively. Roughly 48.7 percent of Brooklyn residents work in Anne Arundel County with some working as far south as Annapolis.

Zip Code Employees 21201 196 21202 21230 133 21227 108 21215 95 21225 78 21061 75 [40] 21076 70 21224 68 21218 [40] [173] Patapsco **Employees Per Zip Code** 61 - 70 71 - 78 79 - 108 109 - 133 134 - 196 2.5

Business Employee Location

To determine where the area's employees are traveling from, employees' residences were mapped for the major employer concentrations in Fairfield and Locust Point, to show the concentrations of employees in Economic Study Area neighborhoods.

Locust Point has 351 of its 5,476 employees living in the Economic Study Area. Overall, 6.4 percent of employees in the Locust Point Peninsula (Locust Point and Locust Point Industrial Area neighborhoods) live in the Economic Study Area (see **Figure B. 13**). Only 0.9 percent lives south of the Vietnam Veterans Memorial Bridge in Cherry Hill, Brooklyn, or the Fairfield Industrial Area. The greatest concentrations of employees are in Riverside (2.2 percent) Locust Point (1.9 percent).

Figure B. 13: Locust Point Employees Residing in Economic Study Area Neighborhoods, 2014

Source: Census On the Map, 2014; AECOM, 2016

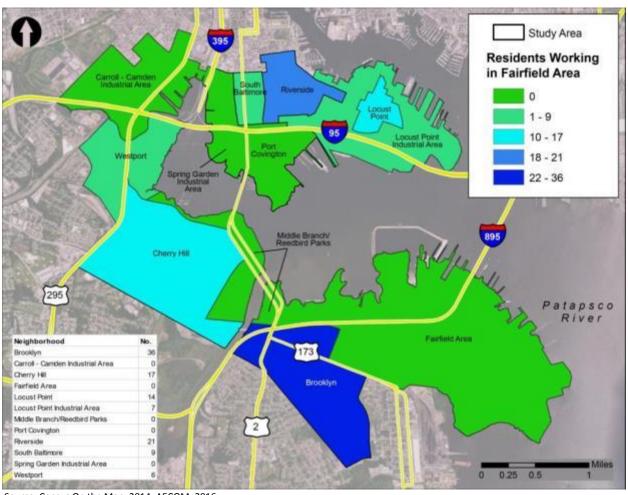

Figure B. 14 shows that while some Fairfield workers do live in the Economic Study Area neighborhoods, most do not. A separate analysis showed that 19.5 percent of Fairfield workers live in Dundalk, and 9 percent live in the Lake Shore area. Only 3.2 percent of all Fairfield workers live in the Economic Study Area neighborhoods. Though there are no great concentrations of employees living in the Economic Study Area neighborhoods, the neighborhood with the highest concentration is Brooklyn, where 1.0 percent of employees in Fairfield live.

Figure B. 14: Fairfield Industrial Area Employees Living in Economic Study Area Neighborhoods, 2014

Source: Census On the Map, 2014; AECOM, 2016

Public Transportation

Because of the role transit plays in access to employment opportunities, this analysis considers the transit facilities available within the Economic Study Area. The City of Baltimore and the State of Maryland offer various public transportation systems to service Baltimore City and surrounding areas. There are currently four major transportation systems servicing Baltimore: Charm City Circulator, MDOT MTA Light Rail, MDOT MTA Metro, and MDOT MTA Bus. While these systems do provide service to

Baltimore's daytime population, service quality and quantity are not the same throughout the entire city. Charm City Circulator, the city's free shuttle service, only services the east portion of the Economic Study Area as seen in **Figure B. 15.** It is important to note that Charm City Circulator's hub is located in Cherry Hill but does not offer any routes or stops to service that area. MDOT MTA Light Rail has a line servicing residents near Cherry Hill, Westport, and the Carroll-Camden Industrial Area. MDOT MTA Bus also offers routes to service the aforementioned neighborhoods in addition to Brooklyn, South Baltimore, and Port Covington. While these bus routes do exist, stakeholder interviewees suggested that they may not be enough to get the residents of these neighborhoods to their places of employment. **Figure B. 4** shows how many households by census tract have zero vehicles available throughout the entire Economic Study Area. According to Census data, about 72 percent of all households in a census tract in Cherry Hill have no cars available. Residents in Cherry Hill and other South region neighborhoods are more likely to rely on public transportation than East region neighborhoods within the Economic Study Area. Despite these needs for transportation, networks and service are still somewhat limited. During stakeholder interviews, lack of accessible and effective transportation for South and West region neighborhoods was brought up repeatedly.

Figure B. 11 shows where residents of Cherry Hill work by ZIP code. Most Cherry Hill residents do not work where they live. Since 72 percent of households in Cherry Hill also do not own vehicles, they rely heavily on public transportation. By improving existing transportation infrastructure and creating a multimodal neighborhood, Cherry Hill residents will be able to get to their places of employment more easily, efficiently, and safely. According to the MDOT MTA Trip Planner (which is powered by Google Maps), a resident living in Cherry Hill using MDOT MTA Bus to get to The Walters Art Museum would take anywhere between 31 to 47 minutes depending on departure time. The Walters Art Museum was chosen as a work destination since it is located in the heart of the 21201 ZIP code, which is where almost 200 Cherry Hill residents work. Looking up the same trip on Google Maps by car would take only 10 to 20 minutes depending on traffic. The same trip would take 26 minutes by bike. While bikes are a more affordable method of transportation and would take less time to get to the destination, in this particular case, there is a lack of bike and pedestrian infrastructure in the South region of the Economic Study Area. This lack of bike and pedestrian infrastructure does not make these areas conducive to using this alternative mode of transportation.

Real Estate Market Overview

This section gives a snapshot of recent conditions in the rents, occupancy, and development of various land uses including residential, industrial, flex industrial, office, and retail in the Economic Study Area and comparative geographies.

Residential

As previously noted, in the Economic Study Area and Baltimore, more homes are renter-occupied than owner-occupied. Fifty-four percent of homes in the Economic Study Area, and 52 percent of homes in the City of Baltimore are rented rather than owned whereas only 33 percent of homes in the Baltimore MSA are rented. **Table B. 14** shows the distribution of owner-occupied housing by home values. Most owner-occupied housing values are evenly distributed from \$50,000 to \$399,999. In fact, 85.4 percent of all Economic Study Area owner-occupied homes fall into these value ranges. Most owner-occupied homes in the Economic Study Area are worth between \$50,000 - \$99,999 and \$300,000 - \$399,999 with 17.9 and 17.6 percent respectively. A majority – 70.9 percent – of owner-occupied houses in Baltimore are worth between \$50,000 and \$249,999. The Economic Study Area has a higher median home value than the City, at \$219,254 versus \$157,900.

Table B. 14: Owner-Occupied Housing Values of Economic Study Area and Surrounding Areas, 2015

Source: ESRI; AECOM, April 2016.

Owner-occupied housing values may be higher than the City's overall owner-occupied housing values; however, there is disparity within the Economic Study Area itself, as shown in **Table B. 15**. South and west region owner-occupied housing values are lower than east region values. In the south region, 85.4 percent of owner-occupied houses in are worth between \$50,000 and \$199,999. In the west region, 94.6 percent of owner-occupied houses are worth between \$0 and \$199,999. Conversely, 86.1 percent of owner-occupied houses in the east region are worth between \$150,000 and \$499,999. Median values in

the South and West are less than half that of the median home value in the East, where the median home value is \$279,979.

Table B. 15: Owner-Occupied Housing Values of Economic Study Area and Its Regions, 2015

Table B. 16 shows renter-occupied housing values in the Economic Study Area, Baltimore City, and Baltimore MSA. While owner-occupied housing values were higher in the Economic Study Area than they were in the City, renter-occupied housing values are lower in the Economic Study Area than the City. In the Economic Study Area, 74.3 percent of renter-occupied houses have rents between \$0 and \$999. A majority – 85.1 percent – of renter-occupied houses in Baltimore have rents between \$0 and \$1,249. In the MSA, 82.6 percent of renter-occupied houses have rents between \$0 and \$1,499. 23.5 percent of renter-occupied houses in the Economic Study Area and 23.5 percent of renter-occupied houses in Baltimore have rents greater than \$1,000. Almost double – 45 percent – of renter-occupied houses in the MSA have rents greater than \$1,000.

Just as with owner-occupied housing values, renter-occupied housing rents vary greatly among the Economic Study Area regions (see **Table B. 17**). In the south region, 91.9 percent of renter-occupied houses have rents under \$1,000. In the west region, 39.7 percent of renter-occupied houses have rents less than \$500, and 51.1 percent have rents between \$700 and \$1,249. In the east region, 86.8 percent of renter-occupied houses have rents greater than \$700. In the south region, only 5.4 percent of renter-occupied houses have rents greater than \$1,000. In the west region, 23 percent of renter-occupied houses have rents greater than \$1,000. In the east region, 71.8 percent of renter-occupied houses have rents greater than \$1,000. The median rent in the South region is \$654, compared to \$1,414 in the East.

Table C. 3 shows the summary profile of the multifamily real estate market in the Economic Study Area, City of Baltimore, Baltimore MSA, and Maryland. As of Q4 2015, the Economic Study Area has a multifamily vacancy rate of 7.8 percent. The average rental rate for multifamily units in the Economic Study Area is \$1,152, and the average unit is 945 square feet. The average rent per square foot is \$1.08. Currently, the Economic Study Area has 30 multifamily buildings and 5,405 units. The Economic Study Area has an annual average multifamily absorption of 48 units (The "absorption" rate is the rate at which available homes or properties are sold or rented in a specific real estate market during a given period of time). No new units have been delivered in the Economic Study Area since 2011.

Industrial

Table C. 4 shows a summary profile of the industrial real estate market in the Economic Study Area, City of Baltimore, Baltimore MSA, and Maryland. As of Q4 2015, the Economic Study Area had an industrial vacancy rate of 8.4 percent; however the average annual direct vacancy rate is 9.5 percent. The average annual vacancy rate is lowest in the Economic Study Area; the City, MSA, and State have higher vacancy rates. The average rental rate for industrial units in the Economic Study Area is \$4.40 triple net (NNN). Triple net is a type of lease agreement where the lessee is responsible for all asset costs in addition to rent (property taxes, building insurance, etc.). As of Q4 2015, the Economic Study Area's average rental rate is similar to the City and the MSA's average industrial rental rates, which are \$4.90 and \$4.92 respectively. The average annual rent direct (NNN) is \$3.86. Currently, the Economic Study Area has 37 industrial buildings and 2.9 million square feet of industrial space. The Economic Study Area has had a negative annual average industrial absorption of -18,003 square feet, while the surrounding areas have been positive. No new space has been delivered in the Economic Study Area since before 2011.

Because industrial land uses are common in the Economic Study Area, the industrial real estate market within the Economic Study Area was observed in more detail, as tracked by CoStar, a proprietary database of commercial real estate transactions. This observation included breaking down the industrial real estate market by Economic Study Area region and by subcategory. The following subcategories were assessed: distribution, manufacturing, truck terminals, and warehouses. Note that this data only includes tracked rental space on the commercial real estate market, and does not contain owner-occupied space.

As shown in **Table B. 18**, there are 234 industrial buildings (including but not limited to distribution, manufacturing, truck terminals, and warehouses). A majority – 49.1 percent – of industrial buildings are located in the south region. The west region has the most industrial space with 4,226,355 square feet. The average rent per square foot of industrial space in the Economic Study Area is \$5.01. The east region has the highest average rent per square foot with \$6.41. The south region has the lowest average rent per square foot with \$4.51.

Table B. 18: Summary of Industrial Real Estate Market Conditions by Economic Study area and Its Regions

Industrial Summary									
	Buildings	Buildings SQ FT Ave R							
South	115	3,806,786	\$4.51						
West	79	4,226,355	\$4.73						
East	45	1,687,411	\$6.41						
Study Area	234	9,588,123	\$5.01						

Source: CoStar; AECOM, 2016.

Table B. 19 shows a snapshot of the distribution real estate market within the Economic Study Area. There are only six distribution facilities in the Economic Study Area and half of them are in the south region. A majority – 85.5 percent – of industrial distribution facility space is located in the south region.

Table B. 19: Summary of Distribution Real Estate Market Conditions by Economic Study area and Its Regions

Industrial - Distribution									
	Buildings SQ FT								
South	3	371,532	-						
West	2	53,500	-						
East	1	9,325	-						
Study Area	6	434,357	-						

Source: CoStar; AECOM, 2016.

The distribution of manufacturing facilities is almost completely equal among the three regions in the Economic Study Area: 33.3 percent of these facilities are in the south region, 30 percent are in the west, and 36.7 percent are in the east region. Despite the west region having the fewest number of buildings, it has more than half – 57.5 percent – of all Economic Study Area manufacturing space. The average rent for manufacturing space in the Economic Study Area is \$4.95 per square foot. An average rent figure was not available for manufacturing facilities in the east region. The west region has the highest average rent - \$8.00 per square foot.

Table B. 20: Summary of Manufacturing Real Estate Market Conditions by Economic Study area and Its Regions

Industrial - Manufacturing									
Buildings SQ FT Ave Re									
South	10	398,143	\$4.95						
West	9	833,667	\$8.00						
East	11	221,843	-						
Study Area	30	1,448,553	\$4.95						

Source: CoStar; AECOM, 2016.

Table B. 21 shows a snapshot of the truck terminal real estate conditions within the Economic Study Area. There are four truck terminal facilities within the Economic Study Area. Most of the truck terminals are in the west region. Average rent for truck terminal facilities was only available for the west region and the Economic Study Area as a whole, which is the same: \$10.71 per square foot.

Table B. 21: Summary of Truck Terminal Real Estate Market Conditions by Economic Study area and Its Regions

Industrial - Truck Terminal									
	Buildings	SQ FT	Ave Rent						
South	1	6,300	-						
West	3	39,468	\$10.71						
East	-	-	-						
Study Area	4	45,768	\$10.71						

Source: CoStar; AECOM, 2016.

There are 160 warehouses in the Economic Study Area. 48.1 percent of warehouses are in the south region, 35.6 percent are in the west region; and 16.3 percent are in the east region. Almost half - 45.4 percent - of all warehouse space is located in the west region. The average rent per square foot of warehouse space in the Economic Study Area is \$4.98. The east region has the highest rental rates for warehouse space at \$6.41 per square foot. The west region has the cheapest average rent per square foot at \$3.98.

Table B. 22: Summary of Warehouse Real Estate Market Conditions by Economic Study area and Its Regions

Industrial - Warehouse									
Buildings SQ FT Ave R									
South	77	2,679,152	\$4.19						
West	57	3,097,559	\$3.98						
East	26	1,003,519	\$6.41						
Study Area	160	6,824,514	\$4.98

Flex

In real estate, "industrial flex," or "flex" space, is used to describe industrial buildings that also include some office space. Included in this category are research and development labs, tech/telecom facilities, warehouse with offices but not a warehouse only facility. Generally, they are most often one-story and may or may not be air conditioned. Some have loading docks, though not all. **Table C. 5** shows the summary of flex real estate market performance in the Economic Study Area, City of Baltimore, MSA, and Maryland. As of Q4 2015, the Economic Study Area has a flex vacancy rate of 6.4 percent; however the average annual direct vacancy rate is 10.5 percent. The average annual vacancy rate is lowest in the MSA and second lowest in the Economic Study Area. The average rental rate for flex units in the

Economic Study Area is \$6.60 full service (fs). The average annual rent direct (fs) is \$6.97, which is lower than the City, MSA, and State. Currently, the Economic Study Area has 21 flex buildings and 524,333 square feet of flex space. The Economic Study Area has annual average flex absorption of 4,339 square feet. No new units have been delivered in the Economic Study Area or City since before 2011. The MSA and State have delivered thousands of square feet of rentable building area since 2011.

Within the Economic Study Area, there are 21 flex buildings, with the most being in the south region and the fewest in the east region (see **Table B. 23**). The west region has the most flex space with 287,214 square feet. The average rent per square foot from 2011 to 2015 was \$6.95 in the Economic Study Area. The east region has the highest average rent per square foot for the same time period at \$14.33. The south and west regions have similar average rent per square feet figures of \$7.33 and \$6.75 respectively. The average rents are based on the rates for available space in that time period. Much of the available space in the South and West areas has been in older buildings, while the flex space available in the East is in a newer more office-like flex building.

Table B. 23: Summary of Flex Real Estate Market Conditions by Economic Study area and Its Regions

	Flex - Summary										
Buildings SQ FT Ave											
South	9	159,829	\$6.47								
West	8	287,214	\$6.75								
East	4	77,290	\$16.00								
Study Area	21	524,333	\$6.60

Office

Table C. 6 shows the summary of office real estate market performance in the Economic Study Area, City of Baltimore, MSA, and Maryland. For Class-A office space real estate performance, see **Table C. 7**. For Class-B office space real estate performance, see **Table C. 8**.

As of Q4 2015, the Economic Study Area has an office vacancy rate of 15.1 percent. The average annual vacancy rate is highest in the Economic Study Area; the City, MSA, and State have much lower vacancy rates. The average rental rate for industrial units in the Economic Study Area is \$20.33. As of Q4 2015, the Economic Study Area's average rental rate is slightly less than the City and the MSA's average office rental rates, which are \$21.09 and \$21.90 respectively. The average annual rent direct full service (fs) is \$22.60. Full service is a type of lease where the rent being paid by the lessee includes fees associated with building ownership or maintenance, such as utilities, insurance, taxes, or maintenance. Currently, the Economic Study Area has 103 office buildings and 3,748,964 square feet of office space. The Economic Study Area has annual average office absorption of 32,161 square feet. Since 2011, the rentable building area delivered has averaged 16,111 square feet annually.

Retail

Table C. 9 shows the summary of retail real estate market performance in the Economic Study Area, City of Baltimore, MSA, and Maryland.

The Economic Study Area has a total of 1.8 million square feet of retail in 369 buildings. As of Q4 2015, the Economic Study Area has a retail vacancy rate of 1.2 percent. In the last five years, the average annual vacancy rate was highest in the Economic Study Area – 8.3 percent; the City, MSA, and State have lower average annual direct vacancy rates. The Economic Study Area has a low retail rent. The average rental rate for retail square feet in the Economic Study Area is \$11.62 triple net (NNN). As of Q4 2015, the Economic Study Area's average rental rate is a few dollars less than the City and the MSA's average office rental rates, which are \$14.19 and \$18.26 respectively. The average annual rent direct (NNN) is \$11.53. The Economic Study Area has annual average retail absorption of 14,616 square feet. Since 2011, the rentable building area delivered has averaged only 1,627 square feet annually.

Table B. 24 shows the summary of retail businesses by retail type within the Economic Study Area. Of 193 retail trade businesses in the Economic Study Area, 93 are located in the south region, 41 are in the west region, and 59 are in the east region. In the south region, a majority – 32.3 percent – of the retail trade businesses are food and beverage stores. After food and beverage stores, motor vehicle and parts dealers is the second largest retail trade type by number of businesses in the south region. In the west region, a majority – 22 percent – of retail trade businesses are building materials, garden equipment, and suppliers/ dealers. In the east region the top two retail trades by amount of businesses are food and beverage stores and electronics and appliance stores. In the entire Economic Study Area, food and beverage stores and motor vehicle and parts and dealers are the two largest types of retail trades by number of businesses. Of all retail trade businesses in the Economic Study Area, 23.8 percent are food and beverage stores, and 11.4 percent, which is the second largest share, are motor vehicle and parts and dealers.

Food Deserts

While the data in **Table B. 24** show that the South has the largest number of food and beverage stores, there is still a "food desert" there. "Food deserts" are areas without access to fresh produce and groceries. Many jurisdictions use different measures to define a food desert. The Baltimore Office of Sustainability characterizes food deserts in the *Food Environment Report* as areas where all of the following are true:

- "The distance to the supermarket/supermarket alternative is more than ¼ mile"
- "The median household income is at or below 185 percent of the Federal Poverty Level" (Currently at \$37,296).
- "Over 30 percent of households have no vehicle"
- "The average Healthy Food Availability Index score for all food stores is low"

These factors combined constitute a food desert, by City of Baltimore standards. The Economic Study Area has two food deserts in the South region.

Figure B. 16 shows where the food deserts are and the nearest grocery store and store type.

Grocery Store Type Food Deserts
Convenience South
Small West

Figure B. 16: Economic Study Area Food Deserts and Grocery Stores by Type

Source: City of Baltimore; ESRI; AECOM, 2016

East

Figure B. 4 shows how many households in each census tract within the Economic Study Area have zero vehicles available. There is overlap between the census tract with 72 percent of households without any vehicles available and the food desert closer to the Vietnam Veterans Memorial Bridge. The neighborhoods in the South region of the Economic Study Area have fewer ways to travel to proper grocery stores such as the Shoppers or Harris Teeter on the other side of the Vietnam Veterans Memorial Bridge in the East region of the Economic Study Area. There was previously a Walmart across the Vietnam Veterans Memorial Bridge that served these populations for their grocery needs. When Walmart closed, these neighborhoods were left without an affordable or accessible grocery store.

Hanover Street Corridor Study - Full Rehabilitation

Option 4 - Separate Pedestrian / Bicycle Bridge and General Rehabilitation of the Existing Bridge to Accommodate Six Travel Lanes

(Approach Roadway Work - Not Included)

- * Start with estimate to fix the movable span in the closed position (\$45,821,300)
- * Add cost of separate pedestrian / bicycle bridge

Pedestrian / bicycle bridge

2,300 Feet Long, 18 Feet Out-to-Out \$400/SF
15% added for soft costs and engineering, 5% added for mobilization
Total pedestrian / bicycle bridge cost = 2,300 x 18 x \$400 x 1.2
Total pedestrian / bicycle bridge cost = \$19,872,000

Fix the movable span in the closed position + new pedestrian / bicycle bridge

Total Project Cost = \$45,821,300 + \$19,872,000

Total Project Cost = \$65,693,300

Hanover Street Corridor Study - Replacement

Option 5 - New Six-Lane Bridge and Demolition of Existing Bridge

(Approach Roadway Work - Not Included)

New Six-Lane Bridge

105 feet out-to-out
1,600 feet at \$1,000 per SF (arches and movable span)
400 feet at \$400 per SF (arcades)
300 feet at \$250 per SF (filled retaining walls)
15% added for soft costs and engineering, 5% added for mobilization
Total six-lane signature bridge cost = 105 x (1,600 x \$1000 + 400 x \$400 + 300 x \$250) x 1.2
Total six-lane signature bridge cost = \$231,000,000

Demolition of Existing Bridge

2,300 feet long, 72 feet out-to-out \$75/SF Total demolition cost = 2,300 x 72 x \$75 Total demolition cost = \$12,420,000

New Six-Lane Bridge and Demolition of Existing Bridge

Total Project Cost = \$231,000,000 + \$12,420,000 **Total Project Cost = \$243,420,000**

Hanover Street Corridor Study - Replacement Option 6 - New Four-Lane Bridge and Demolition of Existing Bridge

(Approach Roadway Work - Not Included)

New Four-Lane Bridge

* Same cost estimate methodology as Option 5 (new six-lane bridge), but 24' less wide

Six-lane bridge: 104 feet total (with additional two feet for the rails)

Four-lane bridge: 80 feet (deduct 24 feet/two 12-foot lanes from the six-lane width)

Total four-lane signature bridge cost = 80'/104' x \$231 million

Total four-lane signature bridge cost = \$177.7 million

Demolition of Existing Bridge

2,300 feet long, 72 feet out-to-out \$75/SF

Total demolition cost = $2,300 \times 72 \times 75 Total demolition cost = \$12,420,000

New Four-Lane Bridge and Demolition of Existing Bridge

Total Project Cost = \$177,700,000 + \$12,420,000

Total Project Cost = \$190,120,000
